PRAXIS

Climate Action Plan

What we are doing about our contribution to climate change, at the scale we actually operate, and what we have not yet done.

Issued by	Praxis Brands Ltd, trading as Stennah & Hope, company no. 17222158
Applies to	All of our operations at our current premises. If we relocate, this Plan is revised within three months of the move and the revision is recorded by the Board.
Accountable	The Board of Directors, which approves this Plan and oversees its delivery
Read with	Human Rights Commitment; Responsible Procurement Policy; Supplier Register; Procurement Impact Assessment (HR4.2–4.3 / ESC5.1–5.2)
Version / date	2.0 adopted by the Board on 21 October 2026
Review	Every 12 months from adoption ext review by 21 October 2027 and within three months of any relocation

1. Our commitment

Praxis Brands Ltd supports the global ambition to limit warming to 1.5°C, and commits to reducing our own contribution to climate change.

We are a micro manufacturer. We have not measured our greenhouse gas emissions, and we are not going to publish a number we have not calculated. What follows is our honest account of where our emissions are likely to come from, the actions we are taking, and the dates by which we will have taken them.

2. Where our emissions come from

This is our best understanding, based on what we buy and how we work rather than on measurement. Section 5 sets out when we expect to replace judgement with figures.

Source	What we understand about it	Our judgement
Glass vessels	Glass is energy-intensive to make. On volume and weight, this is likely our single largest source. We do not yet know where the vessels are manufactured or how much recycled glass they contain. They ship from Birmingham and Kent, which is not the same thing. We have asked our glass suppliers (section 4).	Likely largest
Purchased electricity	The only energy we use on site. It runs the wax melters, two thermostatic heaters and lighting. There is no gas supply.	Known source, unmeasured
Wax	Soy, coconut, beeswax and palm. Agricultural materials carry emissions from land use, cultivation and processing.	Significant
Wicks	Cotton, the majority manufactured in Germany. Cotton carries emissions from cultivation, ginning and spinning, and is water- and pesticide-intensive. Small by weight in a finished candle.	Small by volume, high by material intensity

Source	What we understand about it	Our judgement
Inbound freight	Wax from our two UK wax suppliers; vessels from Birmingham or Kent; fragrance oils from France; cotton wicks from Germany. Road and parcel. Not all domestic: two of the four inputs assessed in our Procurement Impact Assessment cross a border to reach us.	Moderate
Outbound delivery	Pallets collected by ELB; small consignments by DHL, DPD and the Post Office. All four carriers move goods in both directions. We own no vehicle.	Moderate
Fragrance oils	Compounded by fragrance houses in the UK and France from ingredients sourced internationally. One supplier is a Grasse house and its compounding location is not yet confirmed. We cannot see past the fragrance house.	Unknown
Packaging	Cartons, fillers and outer packaging, much of it reused rather than bought new.	Small
Waste	Very little leaves the building. See section 3.	Small

3. What we already do

None of this was done for a certificate. It is how a small maker works when materials cost money.

- **We reuse the packaging our materials arrive in.** Incoming cartons and fillers go back out with finished goods rather than into waste.
- **Surplus wax is poured, not binned.** Wax left at the end of a production run is poured into candles and given away.
- **Surplus vessels go to the people who work here** rather than to landfill.
- **We own no vehicle.** We have no company car and no van, so we run no direct transport emissions of our own.
- **We burn no gas on site.** Our heat and our process energy are electric, which means our footprint falls as the grid decarbonises.

4. Our targets and actions

We have no emissions baseline, so we set no percentage reduction targets: a figure calculated from nothing would be a claim, not a target. Each action below has a date, a named owner, an honest note of what it will take, and a test of whether it happened. Dates marked below are proposals for the Board to set.

Target / action	By	Who, and what it takes	How we will know
Establish who supplies our electricity, on what tariff, and whether our unit is separately metered	Q4 2026	Managing Director. Half a day. No cost.	Supplier, tariff and meter arrangement recorded
100% of our electricity on a certified renewable tariff, or, where supply is included in the rent, a written request to the landlord to do so	Q1 2027	Director. Half a day. Tariff cost to be compared before switching.	Contract or landlord reply on file

Target / action	By	Who, and what it takes	How we will know
Record our electricity use every month	From Q1 2027	Director. Ten minutes a month. No cost.	Twelve months of readings by Q1 2028
100% of our glass suppliers asked where the vessels are manufactured and what recycled content they carry	Q4 2026	Director, through the Supplier Register. One hour. No cost.	Answers recorded in the Supplier Register
100% of production input suppliers asked our sustainability questions and their answers recorded	Q2 2027	Director. One hour per supplier, then annual follow-up.	Supplier Register complete for all current suppliers
Fit time controls to the two heaters and set a written switch-off routine for the melters	Q4 2026	Director. Half a day. Cost of two timer controls.	Controls fitted; routine in the production notes
Consolidate outbound parcels and ask 100% of our carriers: ELB, DHL, DPD and the Post Office: what lower-carbon options they offer us	Q2 2027	Director. One day, then a decision.	Written options on file and a decision recorded
Zero production wax or glass to landfill, and the reuse practice written down with volumes recorded	Q1 2027	Director with production. Half a day to write; ongoing recording.	Procedure written; first figures recorded
Produce a first estimate of our emissions using a free small-business calculator	Q3 2027	Director. Two to three days. Free tool.	Estimate published with the method and its limits stated
Offer a refill or vessel-return option to 100% of trade clients	Q4 2027	Director with production. Scoped once the glass suppliers have answered; cost depends on vessel design and how returns are collected.	Written offer on file for every trade client; uptake recorded

A date may be revised only by the Board, only with a recorded reason, and the revision is disclosed in the next impact report.

5. How we track this

Progress against each action is reviewed by the Board at least once a year, alongside our other governance documents. Where an action has been missed, the Board records that it was missed and why, and the next review sets a new date rather than quietly dropping it.

Progress is reported publicly in our annual impact report.

6. Who we talk to about this

A plan written in a back office changes nothing. These are the people whose views shape this Plan and who are affected by it.

Group	Who that means	Influence	How we engage them
The people who work here	Our apprentice and the workers placed with us by our agency	High	Discussed in person as changes are made; anyone may raise a

Group	Who that means	Influence	How we engage them
			concern through our grievance procedure
Suppliers	Wax, glass, fragrance and packaging suppliers, and our manufacturing partner	High	Supplier questions and the Supplier Register; reviewed annually
Clients	The brands and founders we manufacture for	Medium	Direct conversation; refill and packaging options raised as they arise
Couriers and hauliers	ELB, DHL, DPD and the Post Office	Medium	Asked what lower-carbon options are available to an account of our size, alongside the human rights questions in our Responsible Procurement Policy
Trade bodies	None at present. British Candlemakers Federation membership is targeted for Q1 2027; Made in Britain membership is being re-established by Q4 2026.	Low	Through membership once re-established
Our landlord	The owner of the premises we occupy	High	Written requests on energy supply and metering

7. What we do not yet do

- **We have not measured our emissions.** We hold no greenhouse gas inventory, no baseline year and no figure in tonnes of CO2 equivalent. Our targets are therefore actions with dates, not emissions reductions.
- **We do not know how much electricity we use.** That is the first action in section 4.
- **We cannot see into our fragrance supply chain** beyond the UK fragrance houses that compound our oils.
- **We buy no carbon offsets.** We would rather spend a small budget on using less than on buying a claim.

8. If we relocate

We are in discussions to move to a new unit in south-east London. Nothing is settled, and this Plan is written for the premises we occupy today.

If the move completes, we will revise this Plan within three months and the Board will record the revision. A move would change our electricity supply and our inbound freight distances. We would expect it to bring the electricity actions in section 4 forward rather than push them back, and we will say so plainly if it does the opposite.

9. Accountability

This Plan is approved by the Board of Praxis Brands Ltd, which oversees its delivery and does not delegate accountability for it. The Board reviews progress at least once a year, records where the Plan has not been delivered and why, and answers for that to anyone affected by it.

This Plan was reviewed and approved by the Board of Praxis Brands Ltd.

Date: 21/10/2026	Date: 21/10/2026

This Plan is available on request to anyone affected by it. The Board's intention is to publish it at praxisbrands.co.uk alongside our other commitments; until that page exists we do not describe this Plan as published, and the publication date is recorded as a dated commitment rather than stated as done. It supports the Climate Action impact topic under B Lab's V2 standards.
